```

$\land\ \forall\, c \in \mathit{Cowns} : \mathrm{WF}_{\mathit{vars}}(\mathit{RunStep}(c))$

Properties

Ensure that the termination condition is reached by the model.
$\mathit{Termination} \triangleq \Diamond\Box(\forall\, c \in \mathit{Cowns} : \mathit{EmptyQueue}(c))$

Invariants

Ensure that the model produces finite messages.
$\mathit{MessageLimit} \triangleq \mathit{Cardinality}(\mathit{Messages}) \leq (\mathit{Cardinality}(\mathit{Cowns}) + \mathit{MaxMessageCount})$

Cowns are acquired by one running message at a time.
$\mathit{UniqueAcquisition} \triangleq$
LET $\mathit{msgs} \triangleq \mathit{Concat}(\{\langle \mathit{Head}(\mathit{queue}[c])\rangle : c \in \{k \in \mathit{Cowns} : \mathit{running}[k]\}\})$
IN $\mathit{Cardinality}(\mathit{Range}(\mathit{msgs})) = \mathit{Len}(\mathit{msgs})$

Each queue has at most one token message.
$\mathit{LoneToken} \triangleq \forall\, c \in \mathit{Cowns} : \mathit{Len}(\mathit{SelectSeq}(\mathit{queue}[c], \text{LAMBDA } m : m = \{\})) \leq 1$

A running *cown* must be scheduled and be the *max cown* in the message at the head of its queue.
$\mathit{RunningImplication} \triangleq$
$\forall\, c \in \mathit{Cowns} : \mathit{running}[c] \Rightarrow \mathit{scheduled}[c] \land (c = \mathit{Max}(\mathit{Head}(\mathit{queue}[c])))$
